

Get many different programs for the price of one

It just will not do to have single DVD burning software nowadays. To author a DVD one requires more than just mass DVD copying software. One also requires a software that will be able to create inlays for the crystal box. Apart from that, if one is mastering movies, they will also require encoding software with the latest codecs. Most modern movies are bigger in size than a standard DVD can hold.

What with the multiple angle views, different subtitle options and more effects being added on a regular basis, it is but accepted that the size of the final movie will increase. Yet it is not practicable to put the extra few minutes of code on a separate DVD.

It is just not worth it. The cost factors too are not conducive. To bypass this problem, the authors of DVD copying programs have also incorporated a compression algorithm that compresses the movie on the fly as it is being encoded and burnt.

Yes, the modern software, complimenting the speed and buffer memory available with the modern writers, can encode and burn on the fly without creating a coaster. Till a year or two back this was just unimaginable.

Nowadays one can do it comfortably. Not just burning, the new programs can also rip your favorite DVDs. If you do not want to waste extra space taken up by the subtitles and different angle shots, there is the option of ripping out the main movie and burning the same without any loss of clarity, in a much smaller space than the original movie occupied.

The DVD burning software also contains an inbuilt program for creating jewel box inlays. Just select the scenes you like and paste them on a selected template. Now proceed to fill up the relevant text using different fonts till you are pleased.

If you want to gift your creation to someone you love on her birthday, you can use the clip art included with the software for creating an awesome look on the cover. With so much power on their hands, there are chances that some people might make mistakes.

Most DVD copying software have their own online help channel and a few of them have also got dedicated online forums too. If you face any problems with using the software, or if you thing there is a bug in the same, you can report it on the forum or to their helpline. Within a few moments your problem will be fixed.

If you are accustomed to using an older version of the software and are getting lost with the new interface, there is help at hand. Quite a few of the leading companies give you an option to select the classic interface, which shows the same graphic interface you were familiar with.
